

CONFIDENTIAL BUSINESS PLAN | JULY 2026

BUSINESS PLAN & GROWTH VISION

The Digital Business Companion for Small Businesses.

EskoDSK is developing the next generation of virtual employees through intelligent customer portals designed specifically for small businesses.

A customized digital business companion designed to help entrepreneurs communicate, organize, and grow.

EskoDSK AI is building accessible, personalized technology that works alongside the people running small businesses.

Prepared for prospective partners, clients, and investors

ESKODSK AI

BUSINESS PLAN

EskoDSK AI - The Digital Business Companion for Small Businesses

Executive Summary

EskoDSK is a technology company building the next generation of virtual employees through intelligent customer portals designed specifically for small businesses. We create customized digital business companions that understand a company's services, workflows, customers, and daily operations, helping owners communicate more effectively, organize work, and make better business decisions.

Our mission is to make advanced business technology accessible by turning AI into something practical, personal, and useful for small business owners. Rather than building generic software, EskoDSK develops customized portals that become the foundation for each virtual employee experience.

The opportunity	Small businesses need affordable, intelligent support that improves communication, organization, and daily operations.
The approach	A tailored virtual employee plus a business portal that reflects each client's workflow and goals.
The proof point	DasherLab is the first real-world implementation validating the platform model in a medical courier environment.
The North Star	Build a universal platform where a business owner can configure a customized digital companion and manage operations in one place.

The Problem

Small business owners routinely carry several roles at once: customer service, scheduling, sales follow-up, administration, and operations. As their businesses grow, this creates friction that is expensive to solve with traditional hiring or one-size-fits-all software.

- Missed opportunities: inquiries go unanswered or leads are lost when teams are busy serving existing customers.
- Operational drag: repetitive work, disconnected requests, and manual updates consume time that should go to growth.
- Limited access: enterprise platforms can be costly, complex, and poorly suited to a small company's daily reality.

Our Solution

EskoDSK develops digital employees and business portals that make a small business more responsive, organized, and consistent. Every implementation is built around the specific role, industry, workflow, and goals of the business it serves.

A digital employee can support:

- Customer communication and frequently asked questions
- Lead capture and customer request management
- Scheduling, dispatch, and workflow assistance
- Business-specific guidance and status updates

Behind each digital employee is a customizable platform that can include client portals, dashboards, automated workflows, customer management tools, and industry-specific features.

Product Ecosystem

- Custom client portals: branded, organized experiences for customers to submit requests and stay informed.
- Business dashboards: a practical view of requests, workflows, activity, and operational priorities.
- Automation systems: repeatable workflows that reduce administrative effort and keep work moving.
- Virtual employee technology: configurable assistance for communication, scheduling, lead capture, and routine support.
- Industry solutions: modules and workflows shaped for the operating realities of a specific market.
- One platform over time: a growing ecosystem instead of a collection of disconnected software tools.

Current Traction: DasherLab

EskoDSK is in the foundation stage, proving the platform through real-world business applications. The DasherLab Client Portal, developed for a medical courier company, improves communication, streamlines requests, and creates a more organized operating experience.

This implementation is the first working example of EskoDSK combining customized software with the long-term virtual employee vision. It has also led to conversations with other medical courier companies interested in comparable improvements.

Product & Technology Overview

EskoDSK combines customizable business portals, workflow automation, and AI-powered digital employee capabilities into one integrated operating experience. The objective is not a generic chatbot or one-size-fits-all software. It is digital support that reflects the unique processes, knowledge, and service standards of each business.

Client portal layer

Request submission, customer communication, scheduling support, dashboards, workflow management, and industry-specific tools.

Workflow layer

Custom instructions and business processes connect customer requests, internal organization, updates, and repeatable actions.

Digital employee layer

Business-specific assistance for questions, leads, requests, scheduling, routine administration, and guided customer journeys.

Controlled AI Integration

AI is planned as the intelligence layer behind the digital employee experience. The technology roadmap includes large language model integration, business-specific knowledge systems, defined instructions and workflows, automated interactions, and human handoff for complex situations. The design principle is controlled, useful assistance - not replacement of human judgment or relationships.

Scalability by Design

Early customer implementations identify the common workflows that can become reusable platform features. This creates a deliberate progression from customized implementations, to industry templates, to a self-service platform where businesses configure their own experience from pre-built tools and workflows.

- PHASE 1 - Tailored early implementations
- PHASE 2 - Reusable industry templates
- PHASE 3 - Self-service platform configuration

Market Strategy

EskoDSK is launching in the medical courier industry, an intentional starting point where customer communication, dispatch coordination, scheduling, and time-sensitive request management are mission-critical. Starting in one focused industry enables the team to refine the product, learn directly from users, and establish a repeatable implementation model.

Expansion Markets

- Service businesses: home services, cleaning services, contractors, and security companies.
- Operations-heavy teams: transportation, logistics, healthcare services, and property management.
- Client-centered firms: professional services, consulting firms, small retail businesses, and nonprofits.

The common need across these sectors is clear: better communication, stronger organization, and practical automation. EskoDSK will keep a shared platform foundation while adapting the client experience to each industry.

Competitive Advantage

Most software providers ask businesses to reshape their operations to fit a product. EskoDSK takes the opposite approach: we build technology around how a business already operates.

- Industry-specific customization with personalized client experiences
- Flexible software architecture that can begin small and expand with the business
- Virtual employee integration with portals, workflows, and operational tools
- Affordable, scalable solutions designed expressly for small businesses

Financial Opportunity & Business Model

EskoDSK is designed around an affordable entry point that gives small businesses access to customized technology without the high cost typically associated with custom software development. Revenue combines setup services, recurring subscriptions, and premium capabilities that can expand as each client grows.

Market Opportunity	Revenue Model
TAM: 30M+ small businesses. The United States has more than 30 million small businesses - a broad audience for accessible technology support. SAM: service-based businesses. Initial focus: medical courier, healthcare, transportation, property management, home services, and professional services. SOM: focused first-year entry. Target 10-25 paying businesses, refine onboarding, and develop repeatable industry configurations.	Initial implementation: Monthly platform subscription of \$900-\$1,300. Expected per-business setup range: \$50-\$200+. Included in implementation: consultation, portal customization, branding integration, workflow setup, customer experience design, and initial digital employee configuration. Subscription value: hosting, software updates, portal access, digital employee capabilities, workflow tools, automation, and premium integrations. Expansion revenue: additional digital employees, premium automation, industry tools, advanced integrations, multi-location support, and increased usage.

Illustrative First-Year Opportunity

At a target of 25 customers, an average \$1,100 setup fee represents \$27,500 in initial implementation revenue. At an average \$100 monthly subscription, the same customer base represents \$2,500 in monthly recurring revenue. These figures are planning examples, not financial forecasts.

Indicative Unit Economics

- Hosting: estimated \$5-\$10 per active customer per month.
- AI/API usage: estimated \$10-\$20 per active customer per month.
- Data and storage: estimated at approximately \$5 per active customer per month.
- Gross margin: estimated 65-80% at a \$100 subscription, subject to usage and support needs.

24-Month Growth Projection

Illustrative, benchmark-driven model supplementing the Financial Opportunity section - full detail and editable assumptions in the accompanying financial model.

3.0x	LTV : CAC ratio Meets the 3:1 minimum SaaS health benchmark
8.3 months	CAC payback period Within the sub-12-month SMB SaaS target
\$5,299	MRR at Month 24 From 53 active customers, net of 4% monthly churn

New-customer ramp calibrated to the plan's Year-1 SOM target of 10-25 paying businesses; CAC (\$600) and monthly churn (4%) are SMB SaaS industry benchmarks, not measured EskoDSK figures - see Sources tab of the financial model.

EskoDSK AI - The Digital Business Companion for Small Businesses

Go-To-Market & Growth Strategy

Medical courier companies are the first target market because they depend on customer communication, scheduling, dispatch coordination, and request management. DasherLab provides the initial proof of concept and a practical demonstration base for similar organizations.

Customer Acquisition

- Direct relationships: business-owner outreach, industry networking, LinkedIn connections, and targeted email campaigns.
- Demonstration-led sales: understand operational challenges, demonstrate a tailored solution, and present a package that fits the business.
- Referrals and repeatability: use successful client outcomes to build referrals, onboarding discipline, and reusable industry solutions.

Growth Strategy

Our growth plan proves value within focused industries, then uses those successes to expand toward a broad small business technology platform.

Phase 1 - Virtual Employee Foundation

Establish the medical courier model through DasherLab and additional clients. Priorities include completing AI integration, refining the digital employee experience, collecting feedback, and establishing repeatable development processes.

Phase 2 - Industry Expansion

Apply the core platform to adjacent service-based sectors such as healthcare, logistics, property management, home services, professional services, contractors, retail, and nonprofit organizations. The objective is not separate products for every industry; it is a flexible system with specialized configurations.

Phase 3 - Universal Digital Business Companion Platform

Scale from customized implementations to a self-directed platform available to small businesses nationwide. Owners will be able to select an industry, configure workflows, activate their digital employee, create customer experiences, and manage operations in one place.

- NOW - Validate in medical courier
- NEXT - Repeat across related industries
- FUTURE - Scale a universal SaaS platform

Investment & Competitive Opportunity

EskoDSK is seeking strategic investment of \$100,000-\$250,000 to accelerate product development, customer acquisition, and platform growth. The target supports a platform designed to solve a widespread small-business challenge: affordable access to modern technology and dependable digital support.

45% Product development	AI integration, platform improvements, mobile development, and new features.
30% Customer acquisition	Marketing, sales development, industry outreach, and customer demonstrations.
15% Infrastructure	Hosting, security, software tools, data systems, and scalable technology foundations.
10% Operations	Legal services, business operations, and administrative expenses.

Initial Milestones

Funding is intended to support a production-ready digital employee platform and AI integration into existing portal systems, while building a repeatable path to customer acquisition and implementation.

Competitive Landscape

EskoDSK operates at the intersection of custom software, automation, and digital employee technology. Its differentiation is an affordable, adaptable technology partnership for small businesses.

- Enterprise SaaS - powerful features, but expensive and designed for larger organizations.
- Generic SaaS platforms - affordable and widely available, but limited customization.
- AI support tools - automation capabilities, but often lack business-specific workflows.
- Virtual assistants / human support - recurring labor costs.
- Custom software - fully customized solutions, but often too expensive for small businesses.
- EskoDSK - customized portals plus digital employee technology; early-stage platform development.

Long-Term Vision

EskoDSK is not built to replace the human element of business. It is built to give entrepreneurs dependable digital support that handles repetitive work, improves communication, and helps owners focus on serving customers and growing their companies.

A medical courier company may need a digital dispatch assistant. A service company may need a scheduling assistant. A property manager may need a tenant communication assistant. A professional service provider may need client support. EskoDSK is designed to make every one of these experiences personal, useful, and affordable.

The future we are building

A world where every small business can have a customized digital employee working alongside its team - without needing a large technology budget, enterprise resources, or a dedicated IT department.

Conclusion

EskoDSK begins with a proven foundation, an active first client, and a clear path toward expansion. By combining real-world business solutions with scalable technology, we aim to redefine how small businesses access and use digital support.
